"Data comes in many formats, but R prefers just one: tidy data."

- Garrett Grolemund

Tidy data

A data set is **tidy** iff:

- 1. Each variable is in its own column
- 2. Each case is in its own row
- 3. Each value is in its own cell

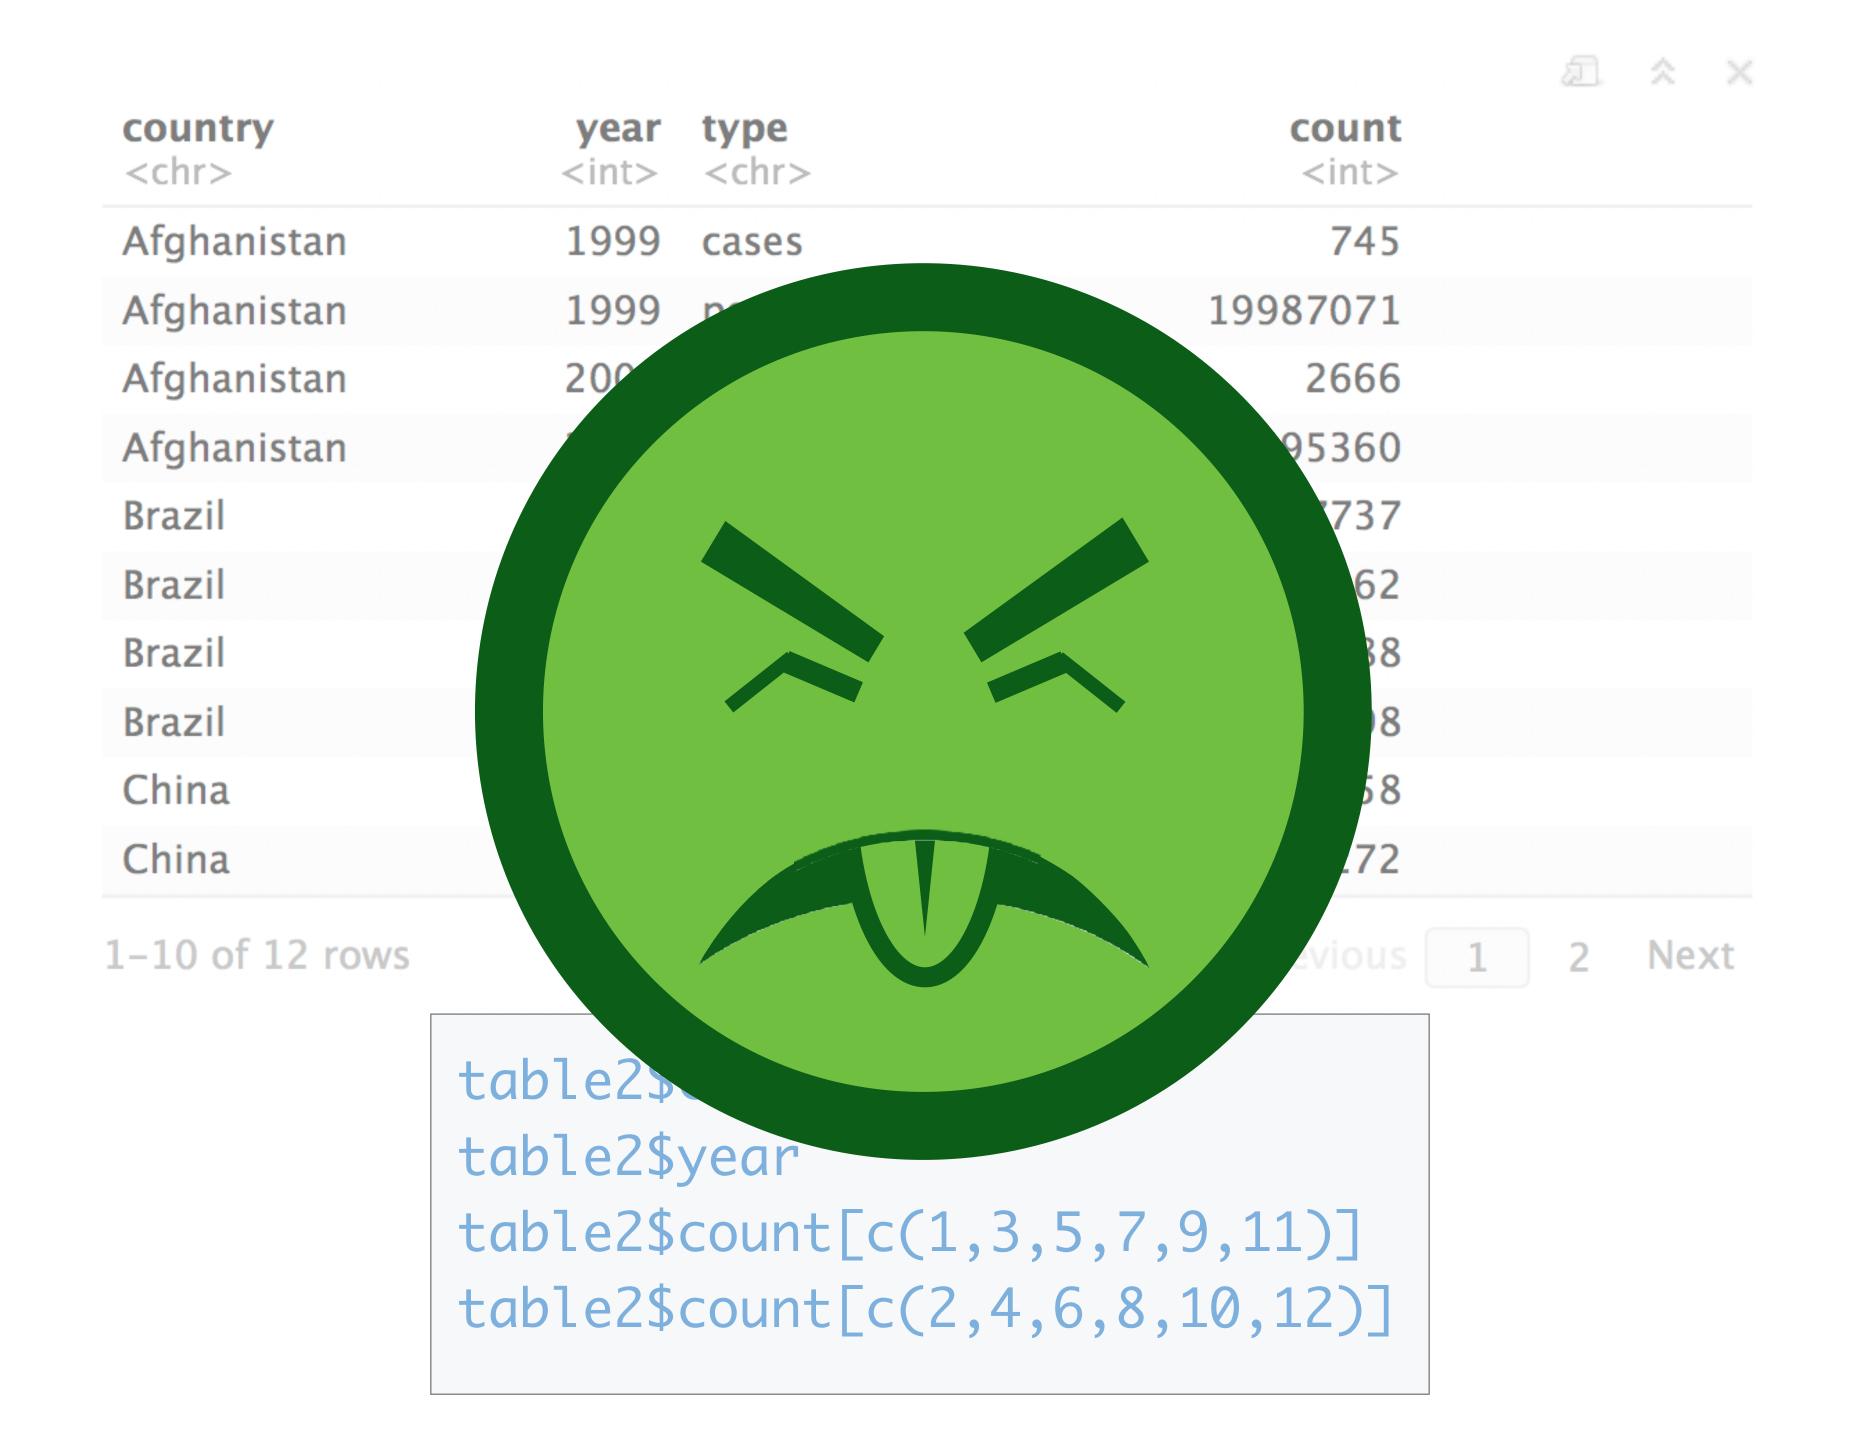

country <chr></chr>	year <int></int>	cases <int></int>	population <int></int>

"Tidy data sets are all alike; but every messy data set is messy in its own way."

- Hadley Wickham

tidyr

tidyr

A package that reshapes the layout of tabular data.

gather()

Toy data

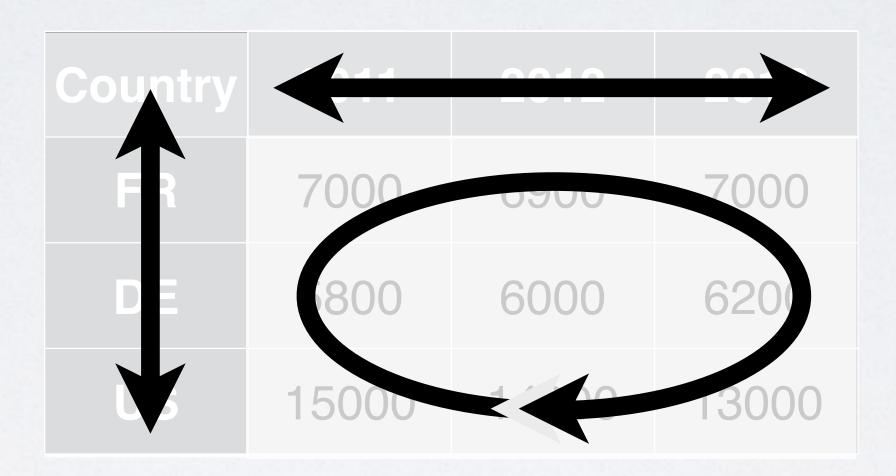

```

Quiz

What are the variables in pollution?

city	particle size	amount (µg/m³)
New York	large	23
New York	small	14
London	large	22
London	small	16
Beijing	large	121
Beijing	small	56

Quiz

What are the variables in pollution?

city	particle size	amount (µg/m³)
New York	large	> 23 A
New York	small	14
Lordon	large	>22
Lordon	small	16
Beling	large	121
Beling	small	56

- City
- Amount of large particulate
- Amount of small particulate

Your Turn 3

On a sheet of paper, draw how this data set would look if it had the same values grouped into three columns: *city*, *large*, *small*

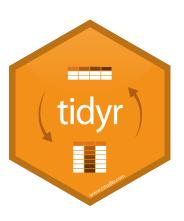

city	size	amount
New York	large	23
New York	small	14
London	large	22
London	small	16
Beijing	large	121
Beijing	small	56

city	size	amount
New York	large	23
New York	small	14
London	large	22
London	small	16
Beijing	large	121
Beijing	small	56

city	size	amount
New York	large	23
New York	small	14

	4	London	small	16				
6 Beijing small 56	5	Beijing	large	121				
	6	Beijing	small	56				

Your Turn 4

Use **spread()** to reorganize **table2** into four columns: country, year, cases, and population.

				』 (2)
country <chr></chr>	-	type <chr></chr>	count <int></int>	
Afghanistan	1999	cases	745	
Afghanistan	1999	population	19987071	
Afghanistan	2000	cases	2666	
Afghanistan	2000	population	20595360	
Brazil	1999	cases	37737	
Brazil	1999	population	172006362	

table2 %>%

spread(key = type, value = count)

	country	Waar	62666	nonulation
	country <chr></chr>	year <int></int>	cases <int></int>	population <int></int>
1	Afghanistan	1999	745	19987071
2	Afghanistan	2000	2666	20595360
3	Brazil	1999	37737	172006362
4	Brazil	2000	80488	174504898
5	China	1999	212258	1272915272
6	China	2000	213766	1280428583

6 rows

WOO

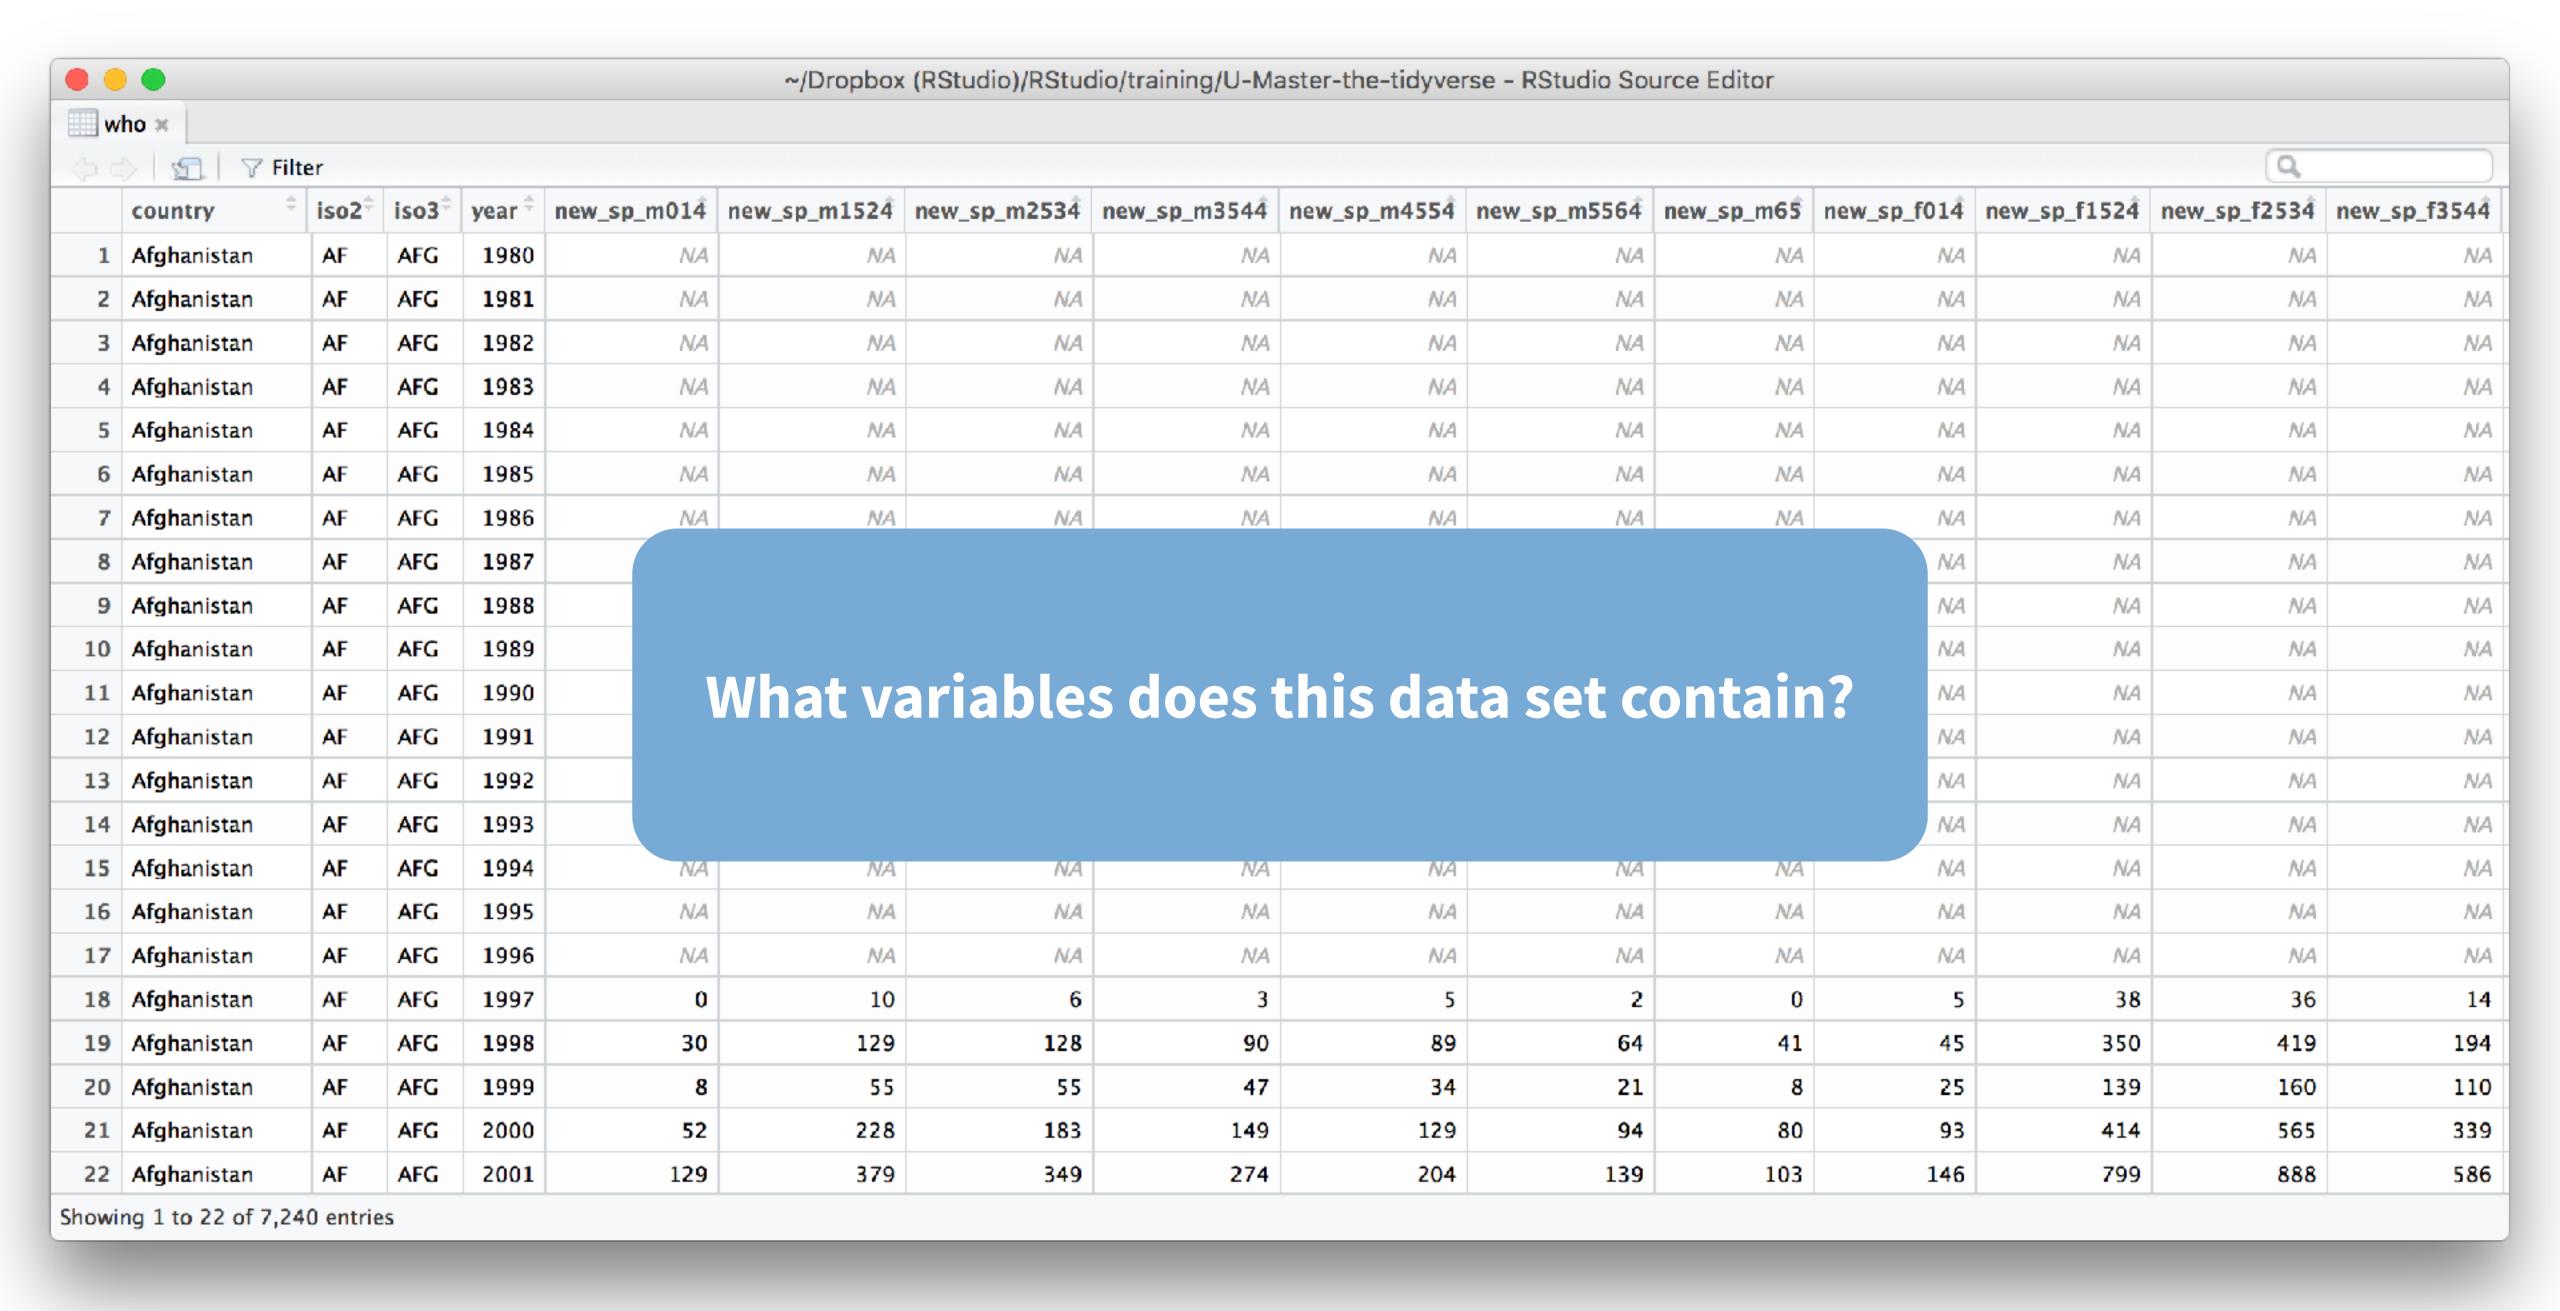

(Untidy Data)

who

Tuberculosis (TB) cases broken down by year, country, age, gender, and diagnosis method from the 2014 World Health Organization Global Tuberculosis Report

View(who)

who variables

country, iso2, iso3 - country identifiers year - year

other columns names - encode type of TB case, sex, and age

who codes

Type of TB case

- rel relapse
- ep extra-pulmonary
- sn- pulmonary, smear negative
- sp -pulmonary, smear positive

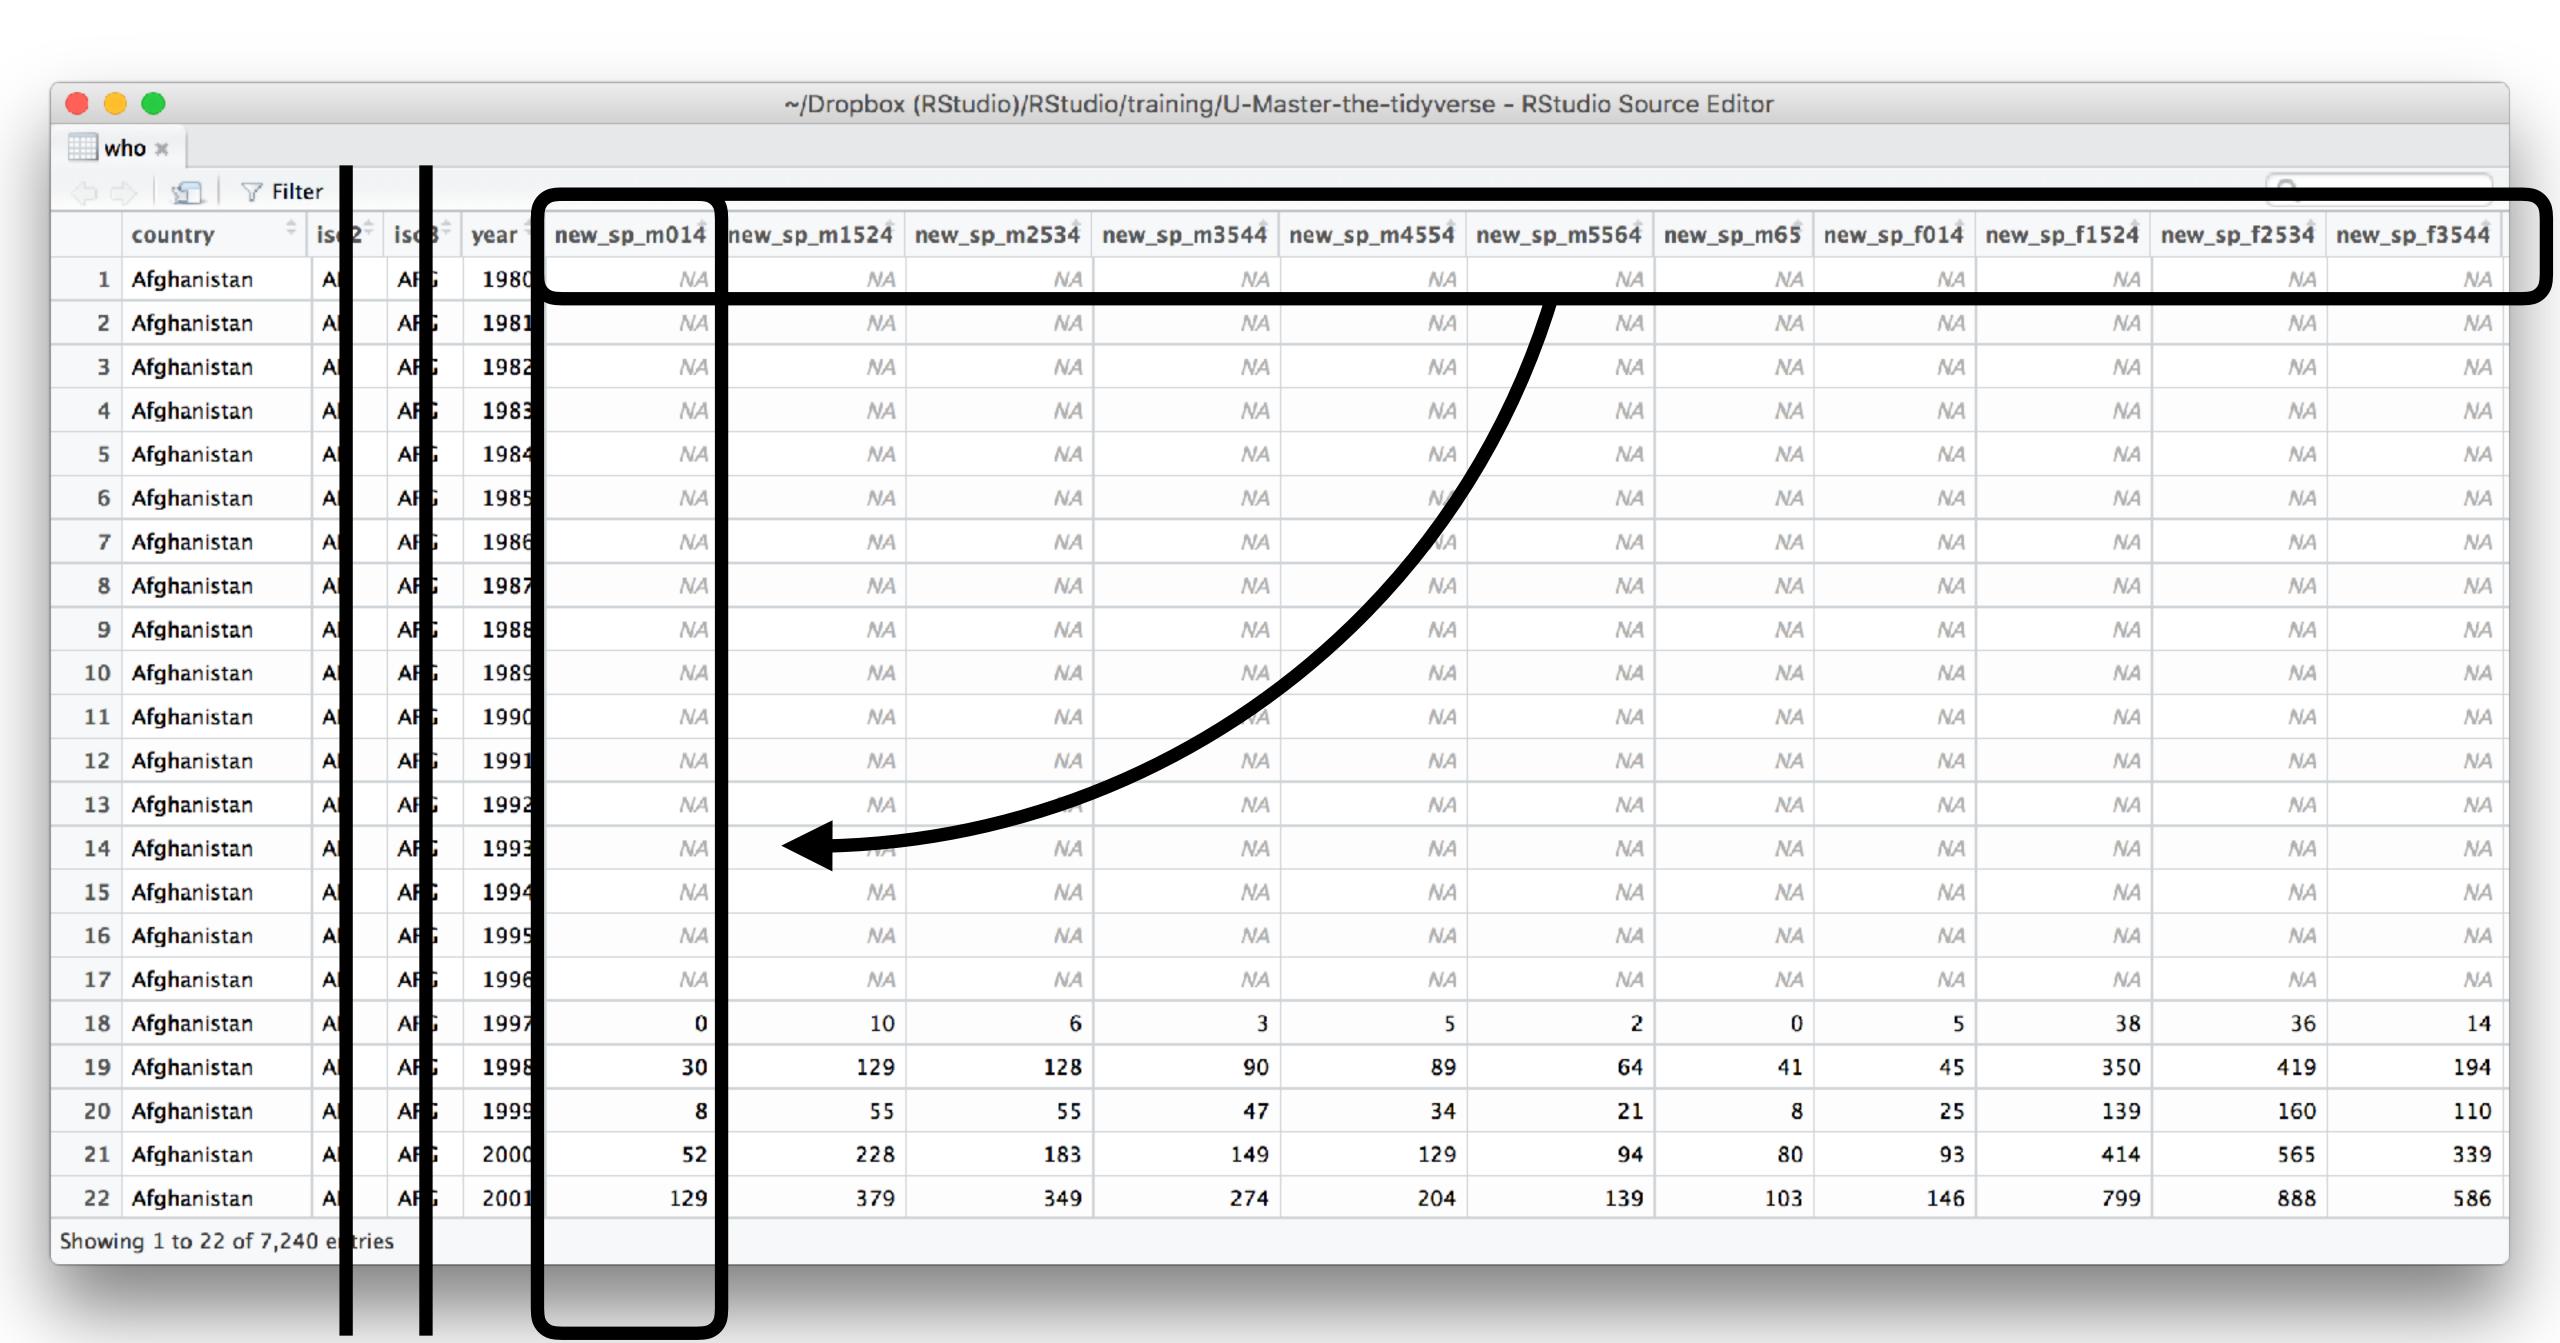

Gender

- m male
- f female

Age group

- **014** 0 to 14 years old
- 1524 15 to 24 years old
- 2534 25 to 34 years old
- 3544 35 to 44 years old
- 4554 45 to 54 years old
- 5564 55 to 64 years old
- 65 65 and older

Your Turn 5

Gather the **5th through 60th** columns of who into a pair of key:value columns named *codes* and *n*.

Then select just the county, year, codes and n variables.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3)
```

country <chr></chr>	year <int></int>	codes <chr></chr>	n <int></int>
Afghanistan	1980	new_sp_m014	NA
Afghanistan	1981	new_sp_m014	NA
Afghanistan	1982	new_sp_m014	NA
Afghanistan	1983	new_sp_m014	NA
Afghanistan	1984	new_sp_m014	NA
Afghanistan	1985	new_sp_m014	NA
Afghanistan	1986	new_sp_m014	NA
Afghanistan	1987	new_sp_m014	NA
Afghanistan	1988	new_sp_m014	NA
Afghanistan	1989	new_sp_m014	NA

separate()

separate()

Splits a column by dividing values at a specific character.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3) %>%
  separate(codes, into = c("new", "type", "sexage"), sep = "_")
                    names of new
                                                 string to split on
     a column to
                     columns to
                                                (Defaults to any non_alpha-
         split
                        make
                                                   numeric character)
```

country <chr></chr>	year <int></int>	codes <chr></chr>	n <int></int>
Afghanistan	1980	new_sp_m014	NA
Afghanistan	1981	new_sp_m014	NA
Afghanistan	1982	new_sp_m014	NA

Afghanistan	1982	sp	m014	NA
Afghanistan	1983	sp	m014	NA
Afghanistan	1984	sp	m014	NA
Afghanistan	1985	sp	m014	NA
Afghanistan	1986	sp	m014	NA
Afghanistan	1987	sp	m014	NA

separate()

Splits a column by dividing values at a specific character.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3) %>%
  separate(codes, c("new", "type", "sexage"), sep = c(4, 7))
```

locations to split at (Split after 4th and 7th characters)

Your Turn 6

Separate the sexage column into sex and age columns.

```
who %>%
  gather("codes", "n", 5:60) %>%
  select(-iso2, -iso3) %>%
  separate(codes, c("new", "type", "sexage"), sep = "_") %>%
  select(-new) %>%
  separate(sexage, into = c("sex", "age"), sep = 1)
```

					100	
	country <chr></chr>	year <int></int>	type <chr></chr>	sex <chr></chr>	age <chr></chr>	n <int></int>
1	Afghanistan	1980	sp	m0	14	NA

6	Afghanistan	1985	sp	m0	14	NA
7	Afghanistan	1986	sp	m0	14	NA

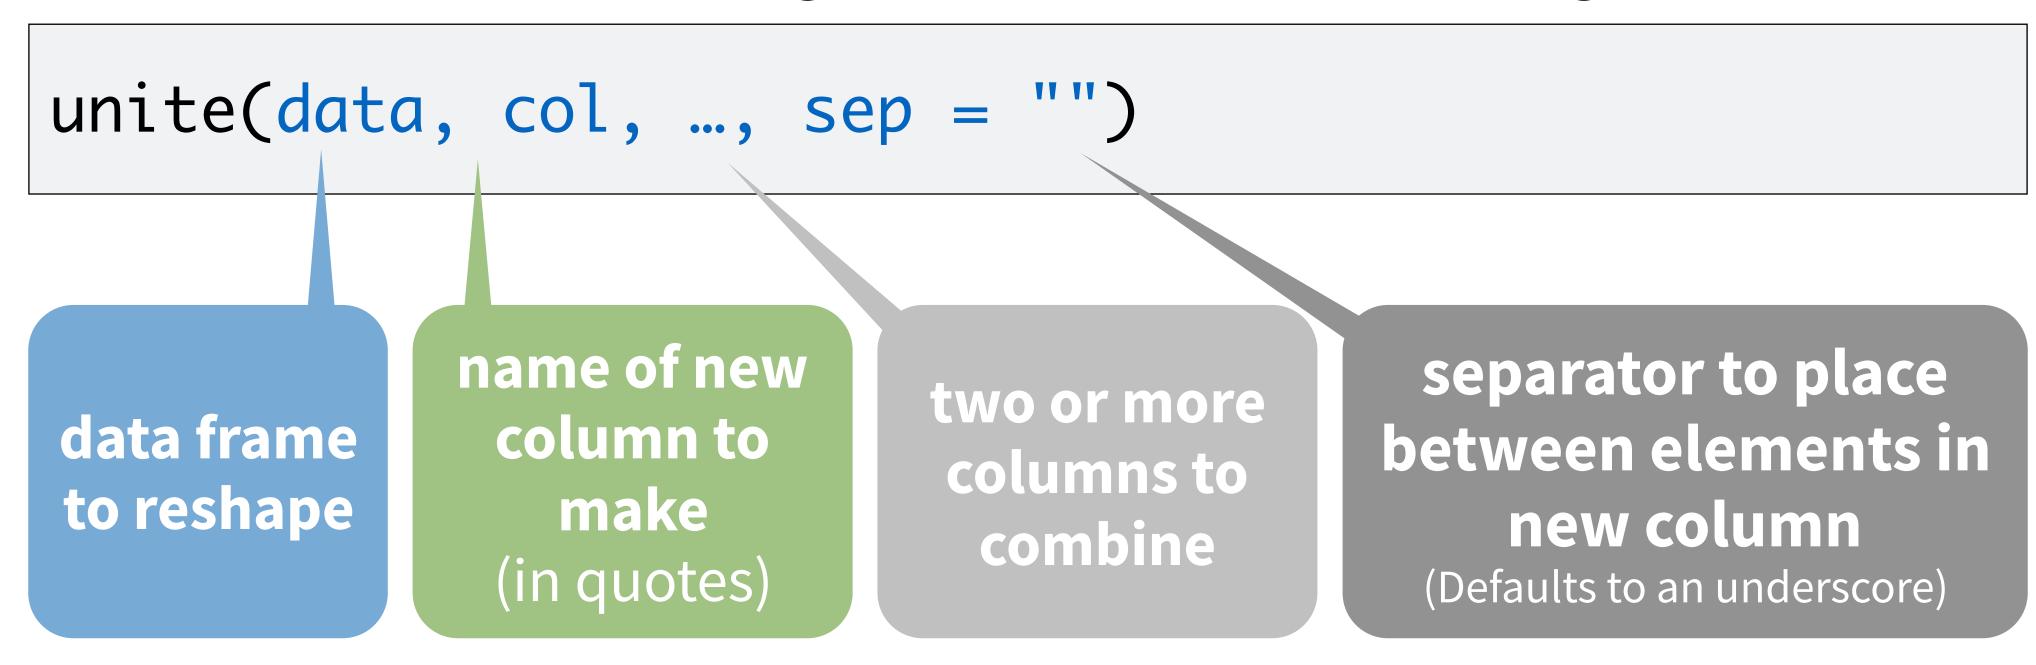

20. A X

unite()

unite()

Unites columns into single column by combining cells.

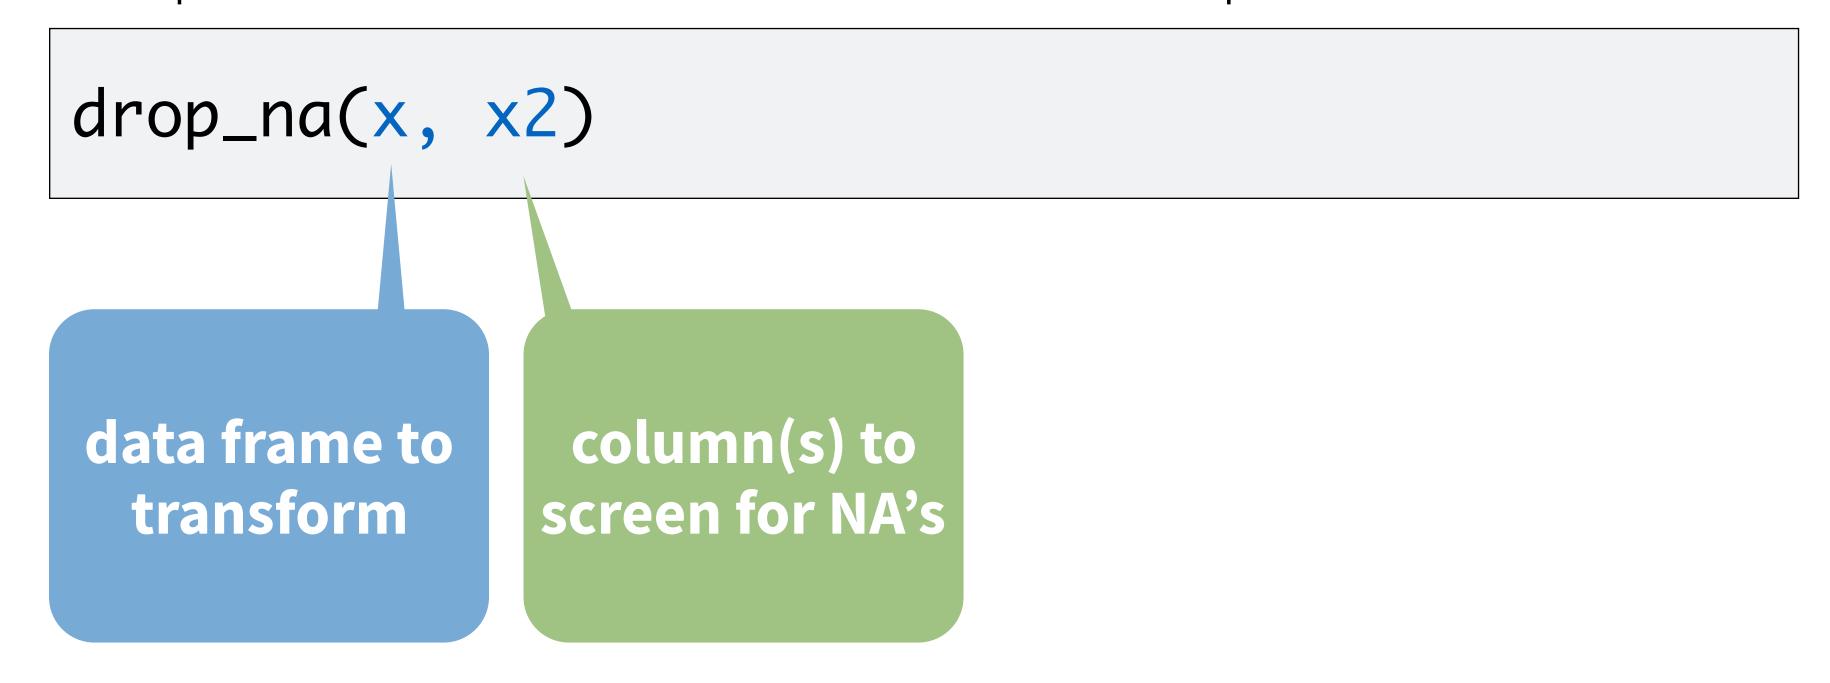

Missing Values

drop_na()

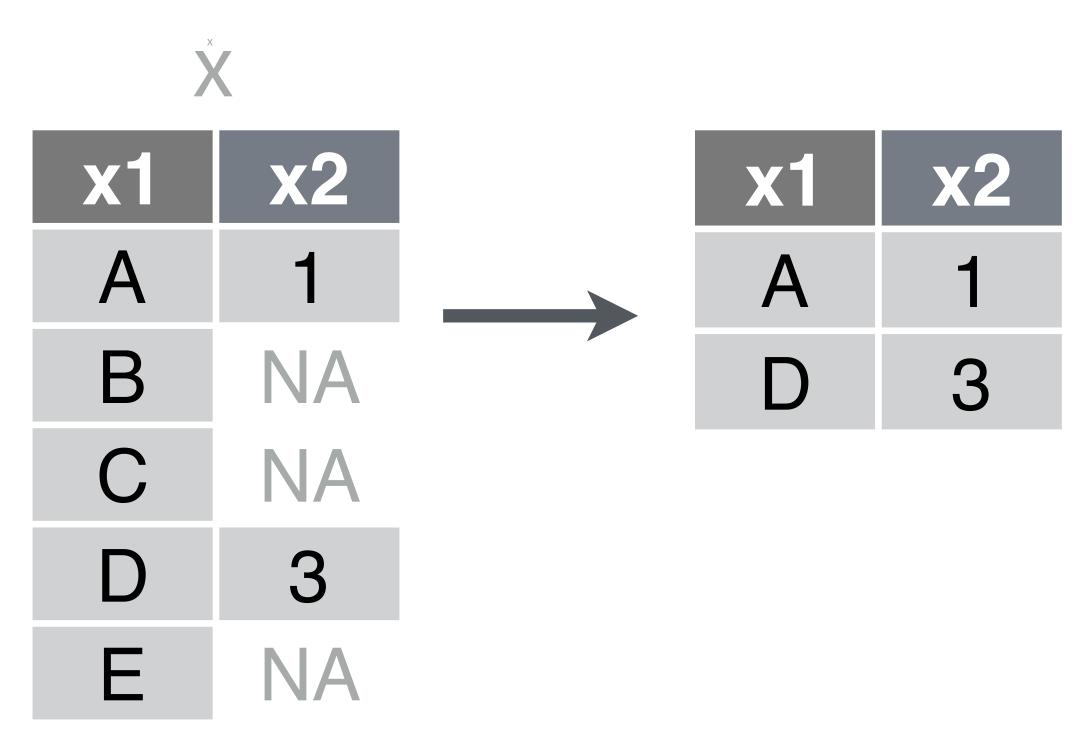

Drops rows that contain NA's in the specified columns.

drop_na()

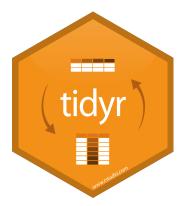

Drops rows that contain NA's in the specified columns.

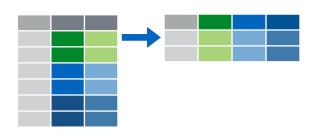

```
who %>%
  gather("codes", "n", 5:60) %>%
  separate(codes, c("new", "type", "sexage"), sep = "_") %>%
  select(-new, -iso2, -iso3) %>%
  separate(sexage, c("sex", "age"), sep = 2) %>%
  drop_na(n)
```

	country	year [‡]	type [‡]	sex [‡]	age [‡]	n [‡]

9	Afghanistan	2005	sp	m0	14	151

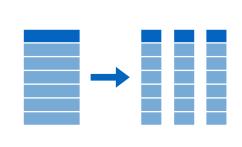

Recap

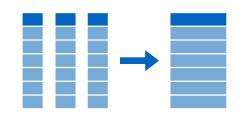

Move values into column names with spread()

Move column names into values with gather()

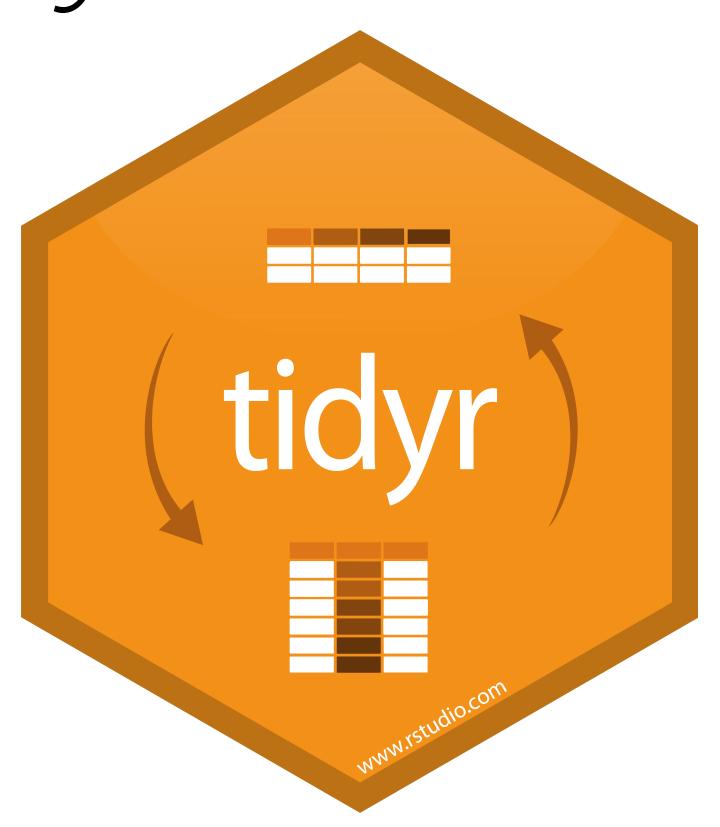

Split a column with separate() or separate_rows()

Unite columns with unite()

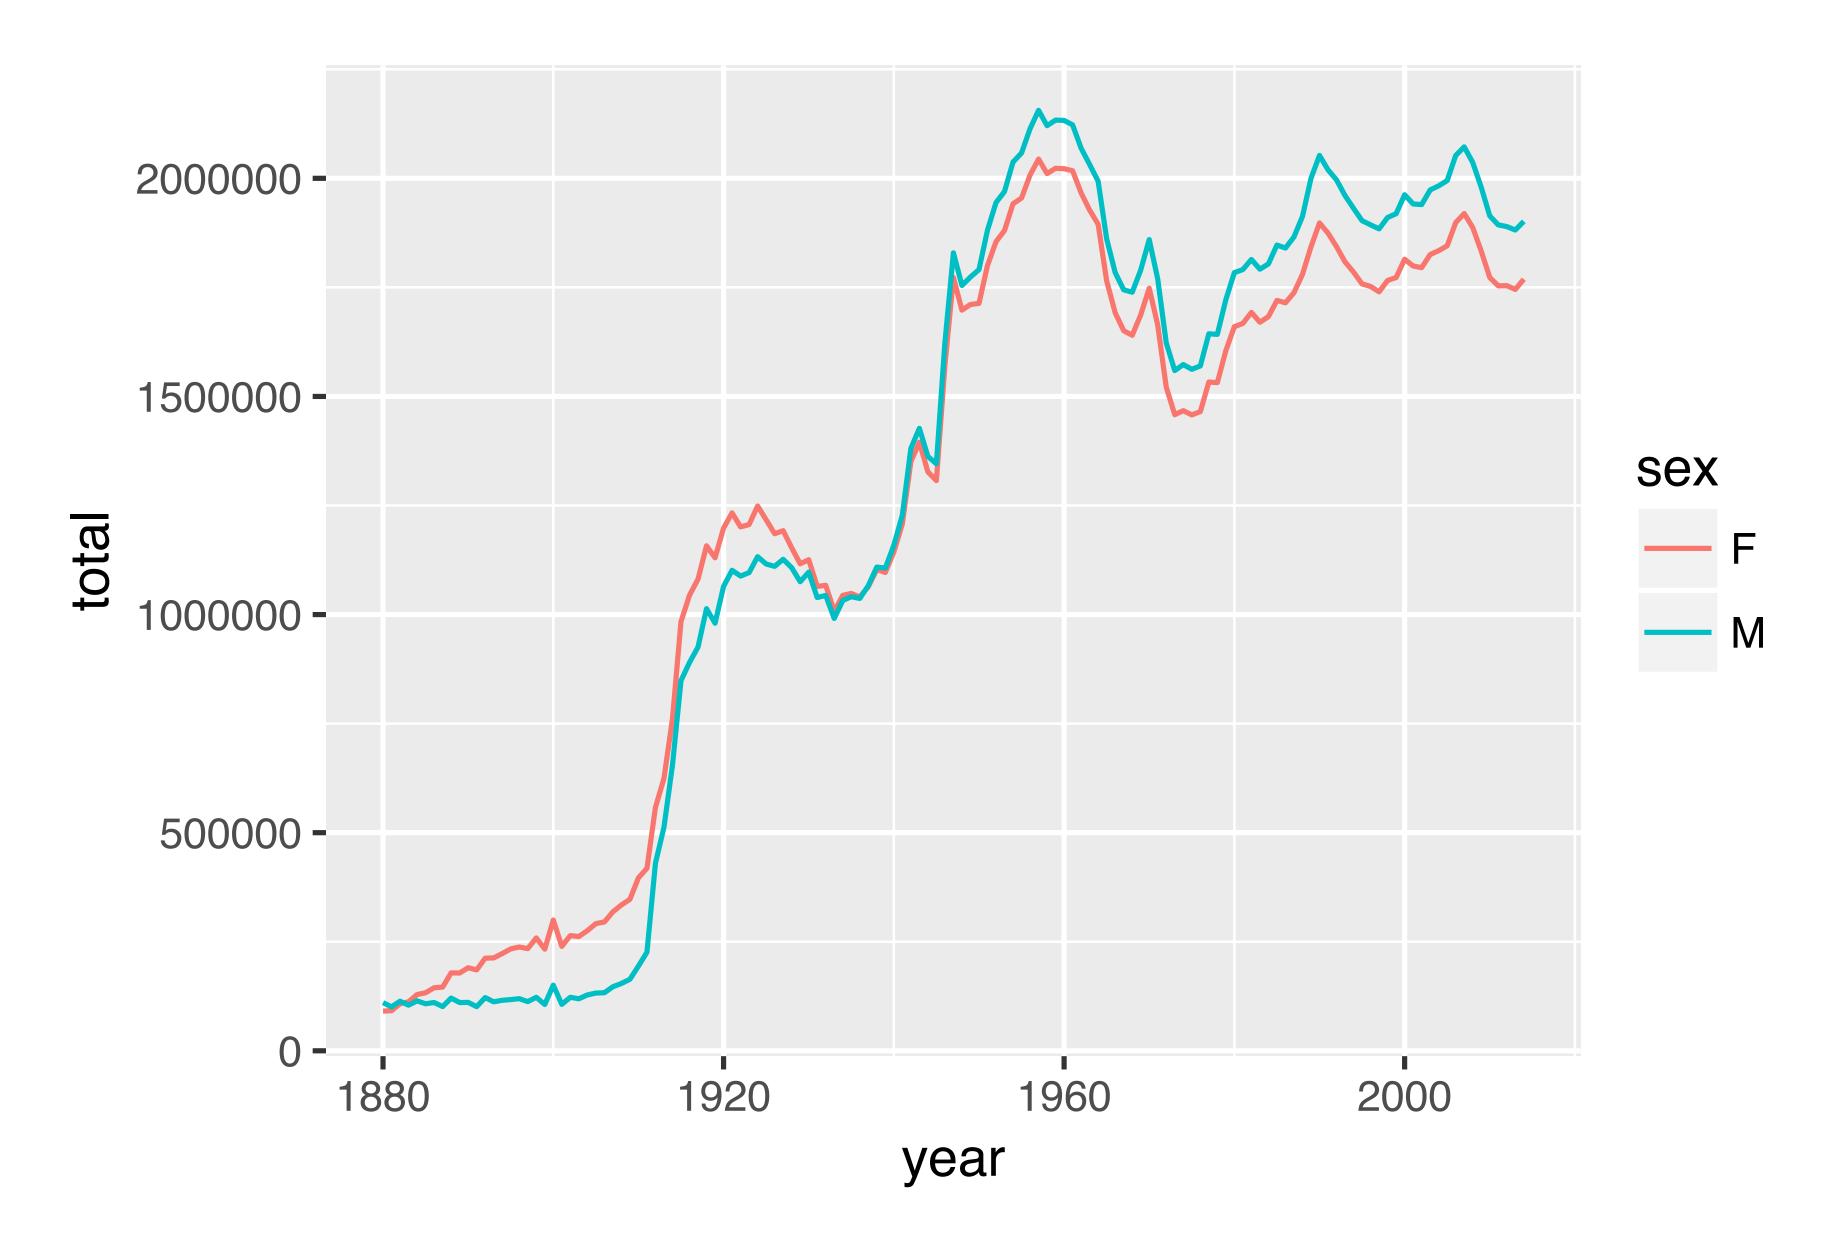

Tidy Data with

Reshaping Final Exam

Number of children by year and gender

Can we calculate the ratio of boys to girls?

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

```
year
            sex
      <dbl> <chr> <int>
       1880 F 90993
       1880
            M 110491
       1881 F 91954
                M 100745
       1882
                F 107850
                M 113688
       1882
CC BY-SA Fotudio
```

Can we calculate the ratio of boys to girls?

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

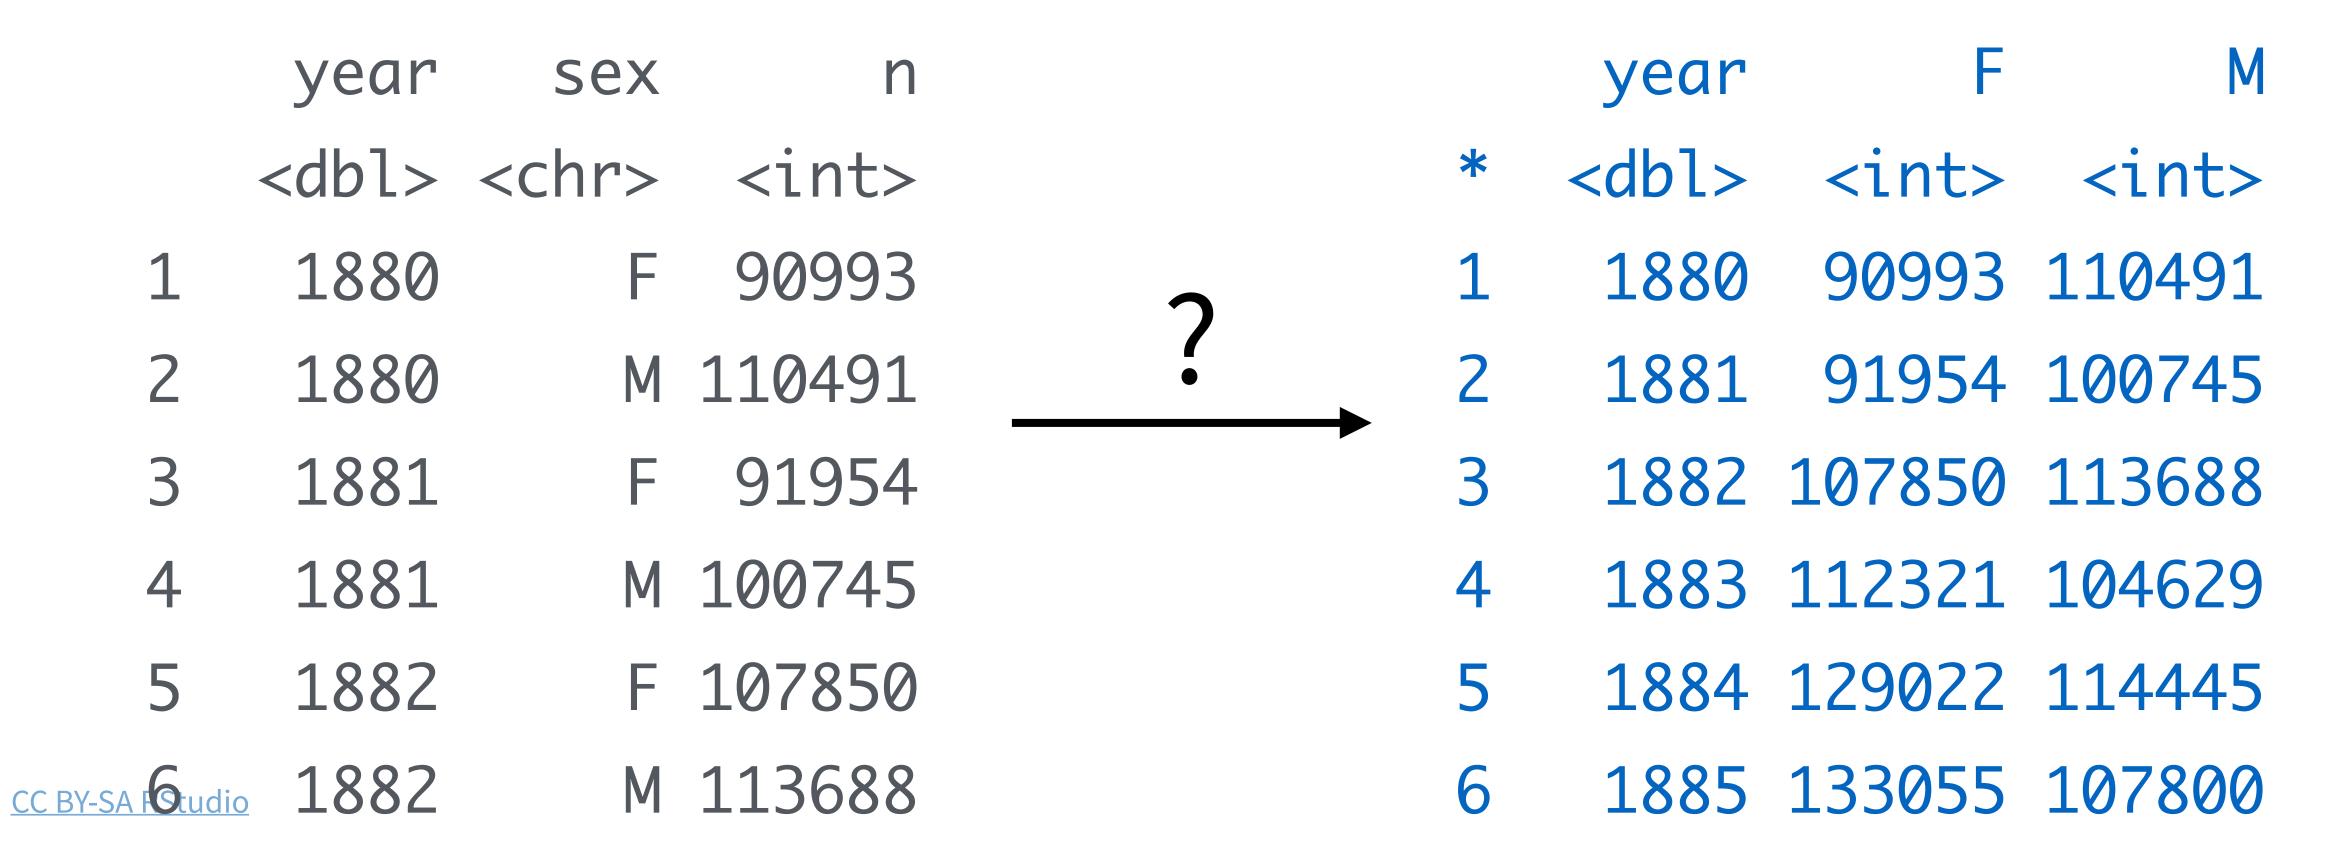

```
year
            sex
      <dbl> <chr> <int>
       1880 F 90993
       1880
                M 110491
       1881 F 91954
        1881
                 M 100745
       1882
                 F 107850
                M 113688
       1882
CC BY-SA Fotudio
```

Now what?

Can we calculate the ratio of boys to girls?

```
better_layout %>%
mutate(percent_male = M / (M + F) * 100)
```

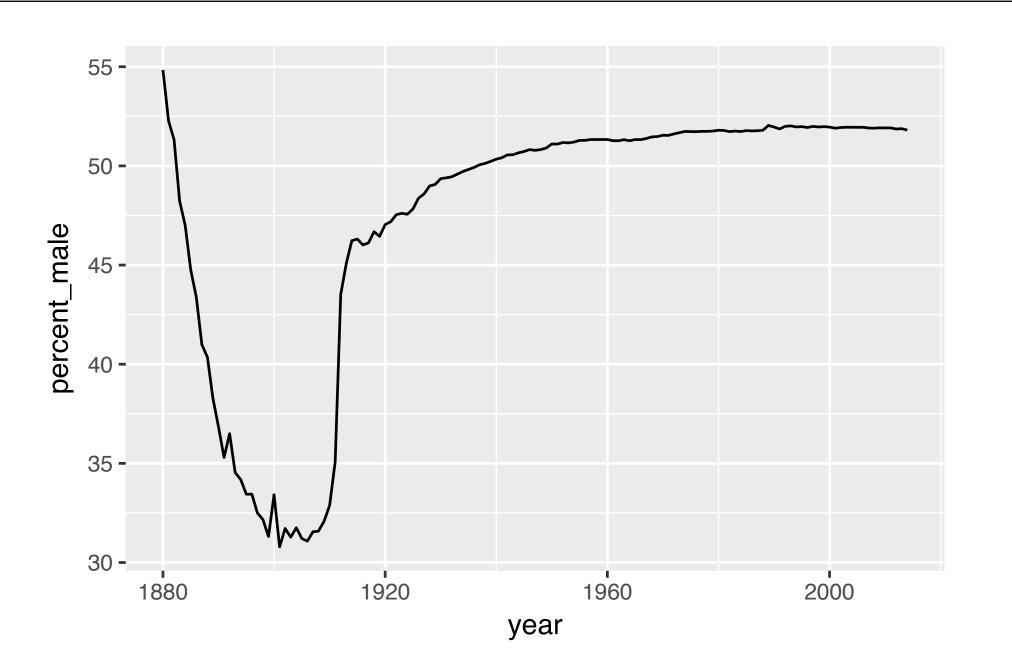

Your Turn 7

Reshape the layout of this data. Calculate the percent of male (or female) children by year. Then plot the percent over time.

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n))
```

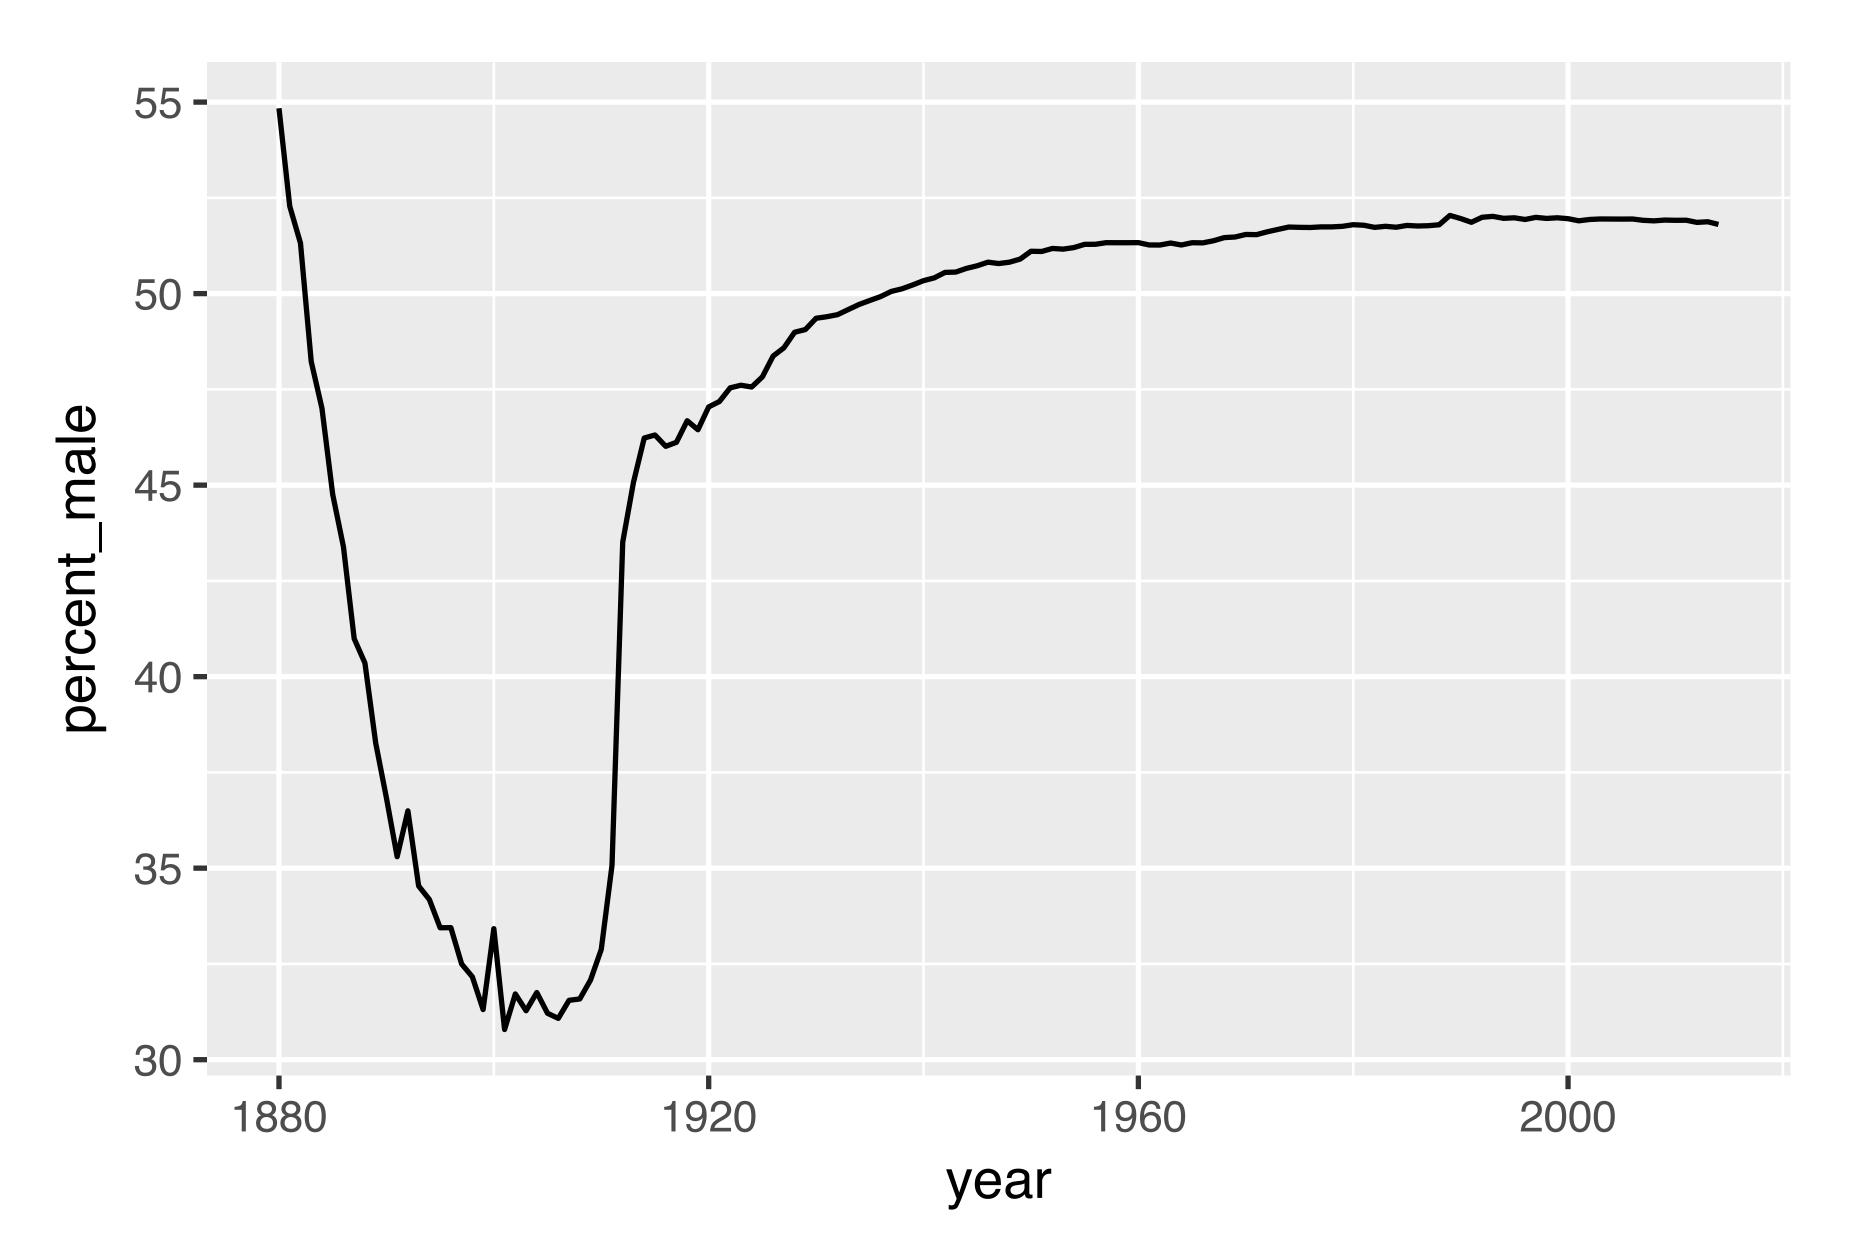

```
babynames %>%
  group_by(year, sex) %>%
  summarise(n = sum(n)) %>%
  spread(sex, n) %>%
  mutate(percent_male = M / (M + F) * 100) %>%
  ggplot(aes(year, percent_male)) + geom_line()
```

Percent of children that are male by year

General advice

Describe what you want to do in an **equation**. Each variable in the equation should correspond to a variable in your data:

- "color by sex"color = sex
- "calculate the proportion of males"
 prop male = number of males / number of females + number of males
